Physics Higher level Paper 3

Monday 20 May 2019 (morning)

	Car	idida	te se	ssior	num	nber	

1 hour 15 minutes

Instructions to candidates

- Write your session number in the boxes above.
- Do not open this examination paper until instructed to do so.
- Answers must be written within the answer boxes provided.
- A calculator is required for this paper.
- A clean copy of the **physics data booklet** is required for this paper.
- The maximum mark for this examination paper is [45 marks].

Section A	Questions
Answer all questions.	1 – 2

Section B	Questions
Answer all of the questions from one of the options.	
Option A — Relativity	3 – 7
Option B — Engineering physics	8 – 11
Option C — Imaging	12 – 16
Option D — Astrophysics	17 – 20

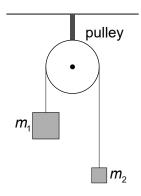

31 pages

Section A

Answer all questions. Answers must be written within the answer boxes provided.

1. In an experiment to measure the acceleration of free fall a student ties two different blocks of masses m_1 and m_2 to the ends of a string that passes over a frictionless pulley.

The student calculates the acceleration a of the blocks by measuring the time taken by the heavier mass to fall through a given distance. Their theory predicts that $a = g \frac{m_1 - m_2}{m_1 + m_2}$ and this can be re-arranged to give $g = a \frac{m_1 + m_2}{m_1 - m_2}$.

- (a) In a particular experiment the student calculates that $a=(0.204\pm0.002)\,\mathrm{ms^{-2}}$ using $m_1=(0.125\pm0.001)\,\mathrm{kg}$ and $m_2=(0.120\pm0.001)\,\mathrm{kg}$.
 - (i) Calculate the percentage error in the measured value of g. [3]

(ii) Deduce the value of *g* and its absolute uncertainty for this experiment. [2]

(This question continues on the following page)

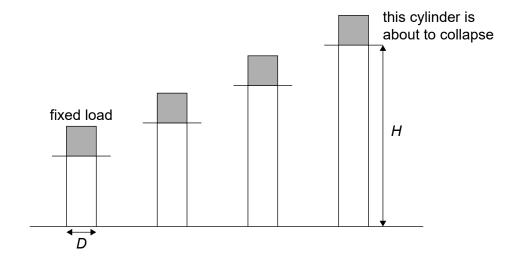

(Question 1 continued)

(b)	The	re is an advantage and a disadvantage in using two masses that are almost equal.	
	Stat	e and explain,	
	(i)	the advantage with reference to the magnitude of the acceleration that is obtained.	[2]
	(ii)	the disadvantage with reference to your answer to (a)(ii).	[2]

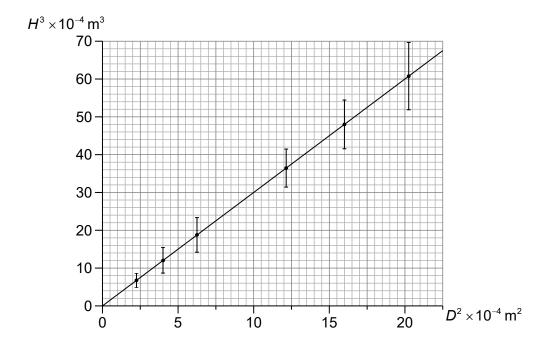

2. In an investigation a student folds paper into cylinders of the same diameter *D* but different heights. Beginning with the shortest cylinder they applied the same fixed load to each of the cylinders one by one. They recorded the height *H* of the first cylinder to collapse.

They then repeat this process with cylinders of different diameters.

The graph shows the data plotted by the student and the line of best fit.

Theory predicts that $H = cD^{\frac{2}{3}}$ where c is a constant.

(This question continues on the following page)

(Question 2 continued)

	a) Suggest why the student's data supports the theoretical prediction.	[2]
(c) Identify one factor that determines the value of <i>c</i> .	(b) Determine c . State an appropriate unit for c .	[3]
(c) Identify one factor that determines the value of <i>c</i> .		
(c) Identify one factor that determines the value of <i>c</i> .		
(c) Identify one factor that determines the value of <i>c</i> .		
(c) Identify one factor that determines the value of <i>c</i> .		
(c) Identify one factor that determines the value of <i>c</i> . [1		
(c) Identify one factor that determines the value of <i>c</i> . [1		
	(c) Identify one factor that determines the value of <i>c</i> .	[1]

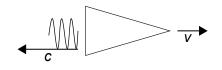

Turn over

Section B

Answer **all** of the questions from **one** of the options. Answers must be written within the answer boxes provided.

Option A — Relativity

3. A rocket moving with speed *v* relative to the ground emits a flash of light in the backward direction.

ground

An observer in the rocket measures the speed of the flash of light to be c.

State the **speed** of the flash of light according to an observer on the ground using

(a)	Galilean relativity.	[1]
(b)	Maxwell's theory of electromagnetism.	[1]
(c)	Einstein's theory of relativity.	[1]

(Option A continued)

- 4. Muons are created at a height of 3230 m above the Earth's surface. The muons move vertically downward at a speed of 0.980 c relative to the Earth's surface. The gamma factor for this speed is 5.00. The half-life of a muon in its rest frame is 2.20 μs.
 - (a) Estimate in the Earth frame the fraction of the original muons that will reach the Earth's surface before decaying according to

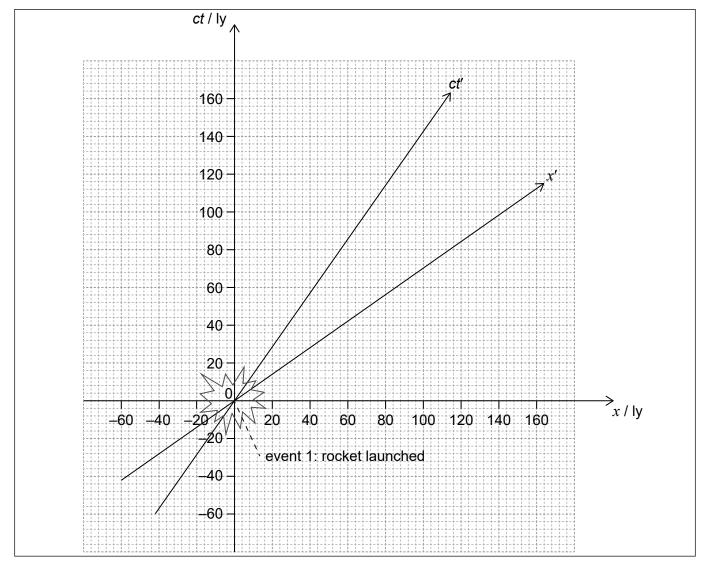

(i) Newtonian mechanics.	[3]
(ii) special relativity.	[2]
	-
(b) Demonstrate how an observer moving with the same velocity as the muons accounts for the answer to (a)(ii).	[2]

(Option A continues on the following page)

(Option A continued)

5. The diagram shows space and time axes x and ct for an observer at rest with respect to a galaxy. A spacecraft moving through the galaxy has space and time axes x' and ct'.

A rocket is launched towards the right from the spacecraft when it is at the origin of the axes. This is labelled event 1 on the spacetime diagram. Event 2 is an asteroid exploding at $x = 100 \,\text{ly}$ and $ct = 20 \,\text{ly}$.

(0)	Diet on the even	the point corre	esponding to event 2	[4]
(a)	Plot on the axes	, the point corre	esponding to event 2.	- 111

(b) Suggest whether the rocket launched by the spacecraft might be the cause of the explosion of the asteroid. [2]

(c)	3110	w that the value of the invariant spacetime interval between events 1 and 2 is 9600
(d)	(i)	An observer in the spacecraft measures that events 1 and 2 are a distance of 120 ly apart. Determine, according to the spacecraft observer, the time between events 1 and 2.
	(ii)	Using the spacetime diagram, determine which event occurred first for the spacecraft observer, event 1 or event 2.
	(ii) 	
 (e)		spacecraft observer, event 1 or event 2.
(e)		spacecraft observer, event 1 or event 2.

(Option A continues on the following page)

[3]

(Option A continued)

6.	The particle omega minus (Ω^-) decays at rest into a neutral pion (π^0) and the xi baryon (Ξ^-)
	according to

$$\Omega^- \rightarrow \pi^0 + \Xi^-$$

The pion momentum is $289.7 \, \text{MeV} \, \text{c}^{-1}$.

The rest masses of the particles are:

 $Ω^{-}$: 1672 MeV c^{-2} $π^{0}$: 135.0 MeV c^{-2} $Ξ^{-}$: 1321 MeV c^{-2}

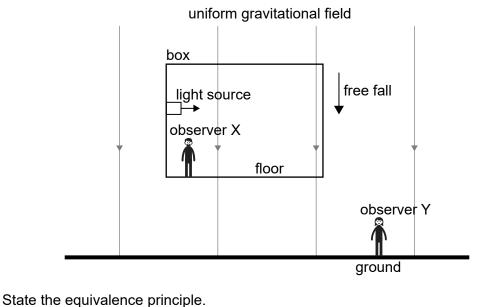

(a)	Show that energy is conserved	in	this	decay
-----	-------------------------------	----	------	-------

(b)	C	alcu	ılate	e th	e s	ре	ed	of	the	e p	ior	١.														[2
										٠.				 			 	 	 	 	 	 		 		
									٠.	٠.	٠.			 ٠.	٠.		 	 	 	 	 	 		 		
			٠.		٠.				٠.		٠.	٠.	٠.	 ٠.	٠.	٠.	 ٠.	 	 	 	 	 	٠.	 		

(Option A continued)

7. A box is in free fall in a uniform gravitational field. Observer X is at rest inside the box. Observer Y is at rest relative to the gravitational field. A light source inside the box emits a light ray that is initially parallel to the floor of the box according to both observers.

State	e and explain the path of the light ray according to	
(i)	observer X.	[2]
(ii)	observer Y.	[2]
	(i)	

End of Option A

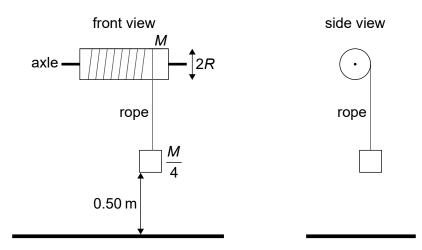

Turn over

[1]

Option B — Engineering physics

8. A solid cylinder of mass M and radius R is free to rotate about a fixed horizontal axle. A rope is tied around the cylinder and a block of mass $\frac{M}{4}$ is attached to the end of the rope.

diagram not to scale

The system is initially at rest and the block is released. The moment of inertia of the cylinder about the axle is $\frac{1}{2}MR^2$.

(a) Show that

	(i)		the	e a	ng	jul	ar	a	CC	ele	era	atio	on	a	ι c	of t	the	e d	cyl	in	de	r i	s	<u>9</u> 31	<u> </u> 											 	[3]	
 																										 		-		 	 			 				
 		٠.		٠.				٠.									-			-						 		-		 	 		-	 				
 		٠.		٠.	٠.			٠.									-		٠.	-	٠.					 	٠.	-		 ٠.	 		-	 ٠.				
 				٠.	٠.					•					•		•									 	٠.	-	•	 	 		•	 	•			
 				٠.													•			-						 		-	•	 	 		-	 	•

 		• •	• •							•			•		•		•									 		•	•	 	 • •	• •	-	 	•	 •		

(ii) the tension T in the string is $\frac{Mg}{6}$.	[1]

(Option B, question 8 continued)

(b)	The block falls a distance 0.50 m after its release before hitting the ground. Show that the block hits the ground 0.55 s after release.	[2]
(c)	The following data are available:	
	R = 0.20 m	
	$M = 12 \mathrm{kg}$	
	Calculate, for the cylinder, at the instant just before the block hits the ground	
	(i) the angular momentum.	[2]
	(ii) the kinetic energy.	[2]

Turn over

(Option B continued)

9. (a) Show that during an adiabatic expansion of an ideal monatomic gas the temperature T and volume V are given by

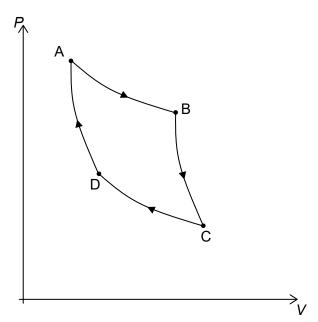

[2]

[1]

$$TV^{\frac{2}{3}} = constant$$

.....

(b) The diagram shows a Carnot cycle for an ideal monatomic gas.

The highest temperature in the cycle is 620 K and the lowest is 340 K.

/i\	Calculate the efficiency of the cycle

.....

(ii)	The work done during the isothermal expansion A \rightarrow B is 540 J. Calculate the thermal energy that leaves the gas during one cycle.	[2]
(iii)	Calculate the ratio $\frac{V_{\rm C}}{V_{\rm B}}$ where $V_{\rm C}$ is the volume of the gas at C and $V_{\rm B}$ is the volume at B.	[2]
(c) (i)	Calculate the change in the entropy of the gas during the change A to B.	[1]
(ii)	Explain, by reference to the second law of thermodynamics, why a real engine operating between the temperatures of 620 K and 340 K cannot have an efficiency greater than the answer to (b)(i).	[2]

(Option B continues on the following page)

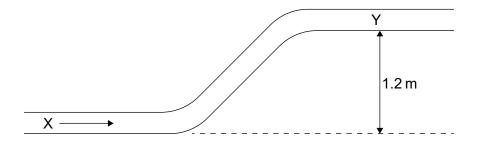

(Option B continued)

10. (a) State **one** condition that must be satisfied for the Bernoulli equation

$$\frac{1}{2}\rho V^2 + \rho gz + p = \text{constant}$$

то арріу.	

(b) Gasoline of density 720 kg m⁻³ flows in a pipe of constant diameter.

(i) Outline why the speed of the gasoline at X is the same as that at Y.	[1]
	•
	•

(ii) Calculate the difference in pressure between X and Y.	[2

(Option B, question 10 continued)

(iii)	The diameter at Y is made smaller than that at X. Explain why the pressure difference between X and Y will increase.	[2

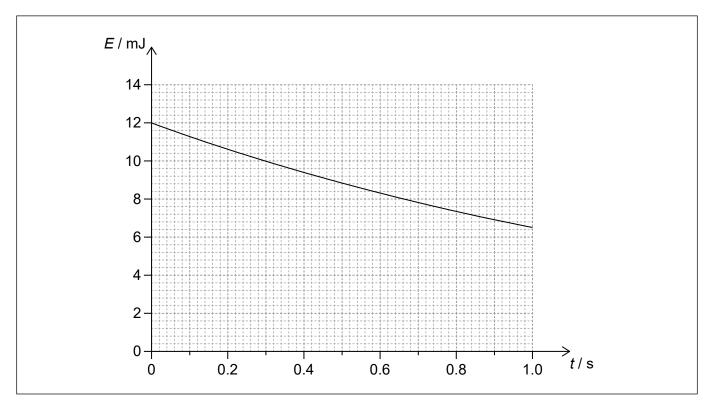

(Option B continues on the following page)

[1]

(Option B continued)

11. The graph shows the variation with time t of the total energy E of a damped oscillating system.

(a)	The Q factor for the system is 25. Determine the period of oscillation for this system.	[3]

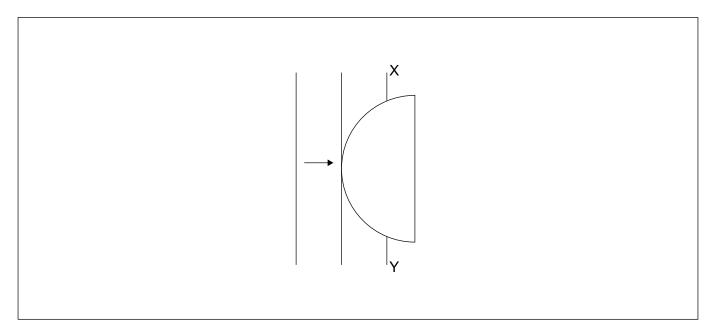

(b) Another system has the same initial total energy and period as that in (a) but its Q factor is greater than 25. Without any calculations, draw on the graph, the variation with time of the total energy of this system.

End of Option B

Option C — Imaging

12. Plane wavefronts in air are incident on the curved side of a transparent semi-circular block of refractive index 2.0.

Part of wavefront XY outside the block is shown.

Draw, on the diagram, the wavefront inside the block.

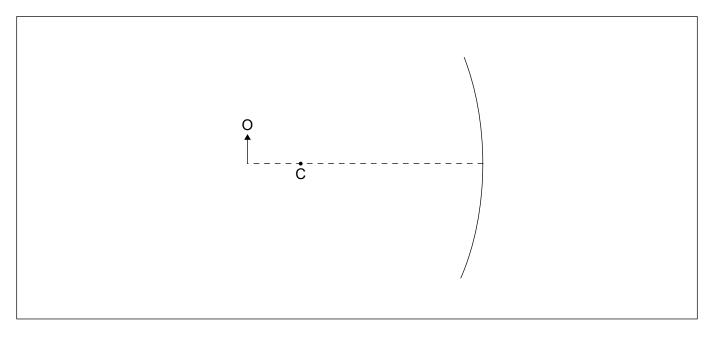

[2]

Turn over

(Option C continued)

13. (a) An object O is placed in front of a concave mirror. The centre of the mirror is labelled with the letter C.

- (i) Label the focal point of the mirror with the letter F. [1]
- (ii) Sketch **two** appropriate rays on the diagram to show the formation of the image. Label the image with the letter I. [3]
- (iii) The upper half of the mirror is blackened so it cannot reflect any light. State the effect of this, if any, on the image. [1]

(Option C, question 13 continued)

(b) A concave mirror of radius 3.0 m is used to form the image of the full Moon. The distance from the mirror to the Moon is 3.8×10^8 m and the diameter of the Moon is 3.5×10^6 m.

(Option C continues on the following page)

(Option C continued)

14. (a) The diagram shows a light ray incident from air into the core of an optic fibre. The angle of incidence is θ . Values of refractive indices are shown on the diagram.

(i) Calculate the critical angle at the core–cladding boundary.

[2]

(ii) Show that the maximum value of θ for which total internal reflection will take place at the core–cladding boundary is about 90°.

[3]

(iii) Comment on your answer to part (a)(ii).

[1]

(Option C, question 14 continued)

(IV		har consists of two rays that enter the core at angle of incluence $\psi = 0$ and $\psi = 0$. Identify a disadvantage of this fibre for transmitting this signal	[2
(1-)	.41: 41		
(b) Ou	tline the	significance of optic fibres in modern communications.	[2

End of Option C

Option D — Astrophysics

17. The Hertzsprung–Russell (HR) diagram shows the Sun and a main sequence star X.

The following data are available for the mass and radius of star X where M_{\odot} is the mass of the Sun and R_{\odot} is the radius of the Sun:

$$M_{\rm X} = 5.0 \, M_{\odot}$$

$$R_{\rm x}=3.2\,R_{\odot}$$

(a)	(i)	Show that the luminosity of star X is about 280 times greater than the luminosity	
		of the Sun L_{\odot} .	[1]

.....

(ii) Determine the ratio $\frac{\text{surface temperature of star X}}{\text{surface temperature of the Sun}}$. [2]

(Option D, question 17 continued)

(b)	The	parallax angle for star X is 0.125 arc-second.	
	(i)	Outline how the parallax angle of a star can be measured.	[2]
• • •			
	(ii)	Show that the distance to star X is $1.6 \times 10^6 \text{AU}$.	[2]
	(11)	Onlow that the distance to star X is 1.0 × 10 Ao.	[2]
	/iii)	The apparent brightness of the Sun is 1400 Wm ⁻² . Calculate, in Wm ⁻² , the	
	(iii)	apparent brightness of star X.	[2]

Turn over

(Opt	ion D	, ques	stion 17 continued)	
	(c)	Star	X will evolve to become a white dwarf star D.	
		(i)	Label, on the HR diagram, the region of white dwarf stars.	[1]
		(ii)	Outline the condition that prevents star D from collapsing further.	[1]
		(iii)	Star D emits energy into space in the form of electromagnetic radiation. State the origin of this energy.	[1]
		(iv)	Predict the change in luminosity of star D as time increases.	[1]
18.	(a)	Ligh	t from a distant galaxy observed on Earth shows a redshift of 0.15.	
		(i)	Outline what is meant by redshift.	[1]
		(ii)	Determine the distance to this galaxy assuming a Hubble constant of $H_0 = 72 \mathrm{km}\mathrm{s}^{-1}\mathrm{Mpc}^{-1}$.	[2]

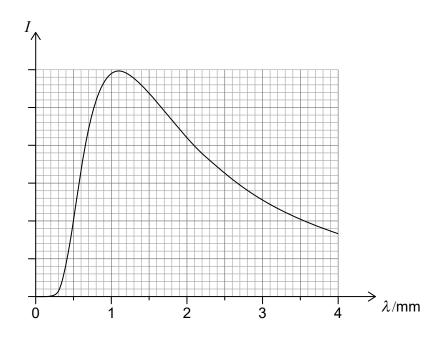

(Option D, question 18 continued)

(b) (i) The cosmic microwave background (CMB) radiation provides strong evidence for the Big Bang model. State the **two** main pieces of this evidence.

[2]

(ii) The graph shows the variation of the intensity I of the CMB with wavelength λ .

Determine, using the graph, the temperature of the CMB.

[2]

(Option D continues on the following page)

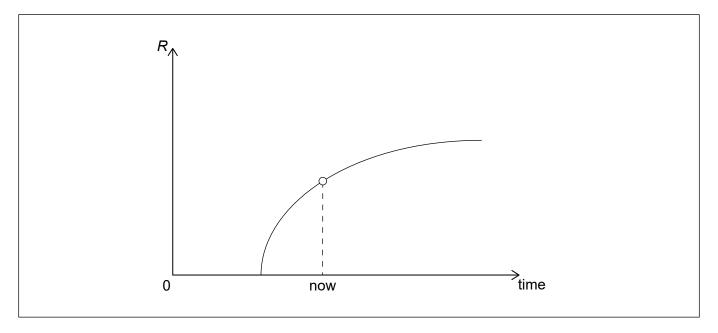

19.	(a)	Des	cribe the mechanism of formation of	
		(i)	type I a supernovae.	[2]
	•••			
		(ii)	type II supernovae.	[1]
	(b)	Sugg the e	gest why type I a supernovae were used in the study that led to the conclusion that expansion of the universe is accelerating.	[2]

(Option D continued)

0.	(a)	Light from distant galaxies is redshifted. Explain the cosmological origin of this redshift.	

(b) The graph shows the variation with time of the cosmic scale factor *R* of the universe for the flat model of the universe **without** dark energy.

(i)	Draw, on the axes, a graph to show the variation with time of the cosmic scale	
	factor <i>R</i> for the flat model of the universe with dark energy.	[1]

(ii)	Compare and contrast, the variation with time of the temperature of the cosmic			
	background (CMB) radiation, for the two models from the present time onward.	[2		

End of Option D
